

FHES (Flanagan Hydrogen Enhanced Silica)

I tested the Active H from Europe with our new Nuclear Magnetic Resonance Spectrometer a few days ago and it exceeds my standard. Also, there is no CO2 gas release. The bubbles are hydride H-gas (not hydrogen H2 or CO2).

My finding on ORP of the Europe Active H is -750 mv after one hour. The product is perfect.

The way we test for ORP is to add one capsule (250 mg Microcluster® Silica Hydride) to 100cc pure distilled water, and wait 1/2 hour before measuring. The H- is time released. I sometimes wait even for one hour.

Kindest regards, Patrick
